

Abstract

A motion picture camera having a film magazine inside of which a film supply reel, from which a motion picture film to be exposed having a 5 supporting layer and a light-sensitive emulsion layer is unwound and moved over a film conveying path past a picture window for picture exposure, and a film winding reel are placed, onto which the exposed motion picture film is wound. A device, which serves to remove foreign 10 bodies located on one or both surfaces of the motion picture film, is placed in the film conveying path between the film supply reel inside the film magazine and the picture window.
